Re: Motherboard Identification

Merit Industries is currently producing two new Mega-Link[®]/TouchTunes[®] kits for use in linking two or more MAXX[™] games together or linking a MAXX[™] game to a TouchTunes[®] jukebox. The two kits contain different contents as they are for use with different versions of MAXX[™] games.

KUV-108-004-02 is a Mega-Link[®] kit that includes an Ethernet card and all necessary hardware to install in any version of MAXX[™] game.

KUV-108-004-03 contains all hardware to link MAXX[™] games that are equipped with the recently released Unicorn motherboard. This kit does not include an Ethernet card, as this is included in the Unicorn motherboard.

In order to determine which kit is required for your game, you will need to be able to identify what motherboard is in your game. The main differences on a Unicorn motherboard are the edge card connectors which are perpendicular to the board (face up) and the mounted Ethernet connector on the board. Below is a visual reference to identify the Unicorn motherboard.

Identifying features:

1. Power connector location
2. Audio daughterboard
3. Processor location
4. DIMM socket: 1 used
5. Ethernet connector
6. DB connectors face up
